# Overview

- 1 Introduction
- 2 Speech Enhancement Framework
- 3 Speech Pre-emphasis Integration
- 4 Speech Dataset
- 5 Experimental Results
- 6 Conclusions and Future Work

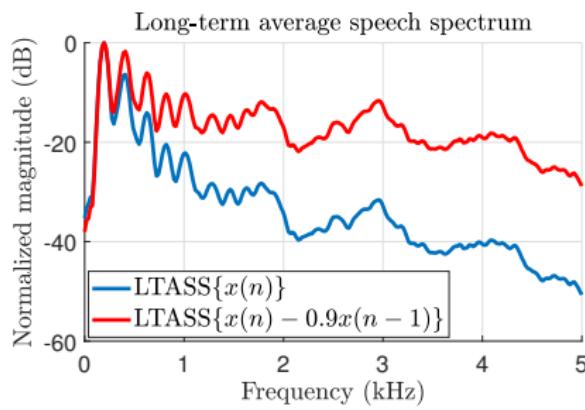

# Introduction

- Speech is characterized by a **spectral tilt** stemming from glottal excitation due to vocal fold vibration
- Spectral tilt may lead to speech processing systems “overlooking” higher frequencies
  - **Perceptually-relevant speech elements such as fricatives, affricates, and some plosives have higher energy at higher frequencies!**

# Introduction

- **Pre-emphasis filtering** is a simple yet effective pre-processing step that compensates high-frequency components by flattening the speech spectrum
- Pre-emphasis filtering is a *default consideration in classical ASR and speech coding systems*

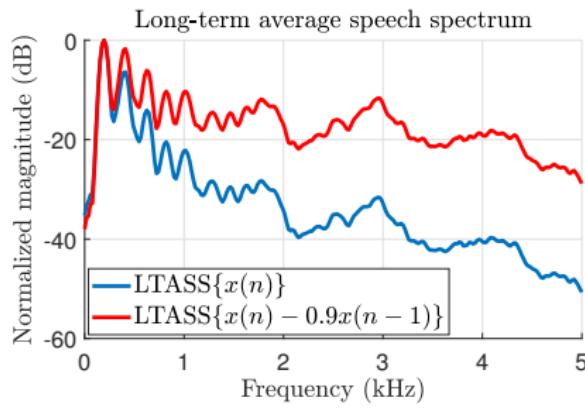

# Introduction

- We study pre-emphasis filtering for DNN-based speech enhancement

## How?

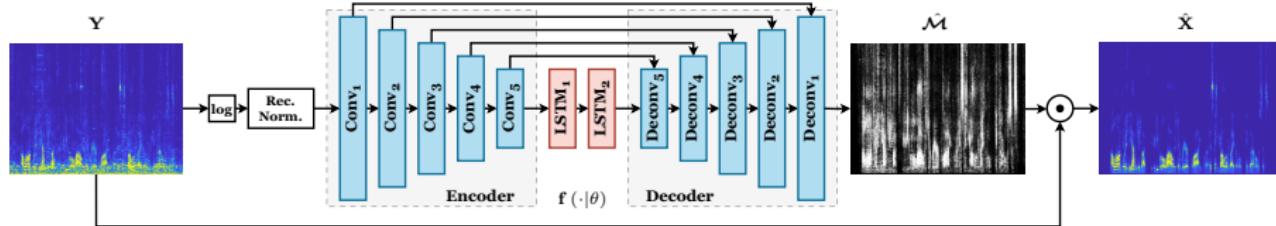

We explore pre-emphasizing the estimated and actual training clean speech during DNN training so that speech is perceptually balanced for loss calculation

- Our expectation is that the contribution of distinct speech frequency components to the total loss better reflects their perceptual importance

# Speech Enhancement Framework

- We use a **spectral masking** scheme for speech enhancement purposes
- The mapping function  $f(\cdot | \theta)$  is deployed by a CRNN
- The enhanced waveform is synthesized by using the phase of the noisy signal

MSE loss function

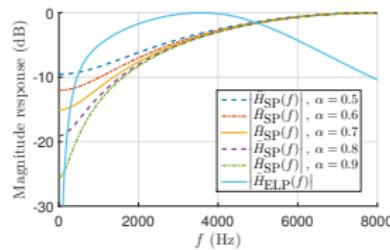

$$\mathcal{L}_{\text{MSE}} = \frac{1}{KT} \sum_{k=0}^{K-1} \sum_{t=0}^{T-1} \left( |\hat{X}(k, t)| - |X(k, t)| \right)^2$$

# Speech Pre-emphasis Integration

- 1 We consider **two pre-emphasis variants** to be integrated into the loss function: **standard pre-emphasis (SP)** and **equal-loudness pre-emphasis (ELP)**
- 2 **Intensity-to-loudness conversion (I2L)** is optionally used to leverage pre-emphasis

## Standard Speech Pre-emphasis (SP)

- First-order high-pass FIR filter  
 $|H_{SP}(f)| = |1 - \alpha e^{-j2\pi f/f_s}| = \sqrt{\alpha^2 - 2\alpha \cos(2\pi f/f_s) + 1}$
- $|\bar{H}_{SP}(f)| \in (0, 1]$  is a scaled version of  $|H_{SP}(f)|$
- $|\bar{H}_{SP}(k)|$  is found by uniform sampling of  $|\bar{H}_{SP}(f)|$

## Pre-emphasized MSE loss function

$$\mathcal{L}_{\text{MSE}}^{\text{SP}} = \frac{1}{KT} \sum_{k=0}^{K-1} \sum_{t=0}^{T-1} \left( |\bar{H}_{SP}(k)| \cdot \left( |\hat{X}(k, t)| - |X(k, t)| \right) \right)^2$$

# Speech Pre-emphasis Integration

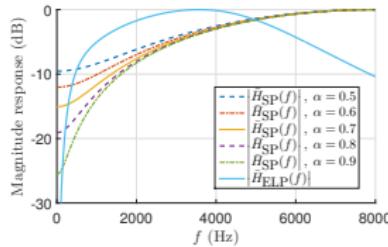

- 1 We consider **two pre-emphasis variants** to be integrated into the loss function: **standard pre-emphasis (SP)** and **equal-loudness pre-emphasis (ELP)**
- 2 **Intensity-to-loudness conversion (I2L)** is optionally used to leverage pre-emphasis

## Equal-loudness Pre-emphasis (ELP)

- ELP approximates the frequency-dependent sensitivity of human hearing at about the 40 dB level:

$$|H_{\text{ELP}}(f)| = \sqrt{\frac{(f^2 + \beta_1)f^4}{(f^2 + \beta_2)^2(f^2 + \beta_3)((2\pi f)^6 + \beta_4)}}$$

- $|\bar{H}_{\text{ELP}}(f)| \in [0, 1]$  is a scaled version of  $|H_{\text{ELP}}(f)|$
- $|\bar{H}_{\text{ELP}}(k)|$  is found by uniform sampling of  $|\bar{H}_{\text{ELP}}(f)|$

## Pre-emphasized MSE loss function

$$\mathcal{L}_{\text{MSE}}^{\text{ELP}} = \frac{1}{KT} \sum_{k=0}^{K-1} \sum_{t=0}^{T-1} \left( |\bar{H}_{\text{ELP}}(k)| \cdot \left( |\hat{X}(k, t)| - |X(k, t)| \right) \right)^2$$

ELP accounts for the decrease in hearing sensitivity at higher frequencies

# Speech Pre-emphasis Integration

- 1 We consider **two pre-emphasis variants** to be integrated into the loss function: **standard pre-emphasis (SP)** and **equal-loudness pre-emphasis (ELP)**
- 2 **Intensity-to-loudness conversion (I2L)** is optionally used to leverage pre-emphasis

## Intensity-to-loudness Conversion (I2L)

- **Cubic-root amplitude compression** simulates the *non-linear relationship between the intensity of sound and its perceived loudness*

### Pre-emphasized MSE loss function with I2L

$$\mathcal{L}_{\text{MSE}}^{\text{SP/ELP+I2L}} = \frac{1}{KT} \sum_{k=0}^{K-1} \sum_{t=0}^{T-1} \left( \left( |\bar{H}_{\text{SP/ELP}}(k)| \cdot |\hat{X}(k, t)| \right)^{\frac{2}{3}} - \left( |\bar{H}_{\text{SP/ELP}}(k)| \cdot |X(k, t)| \right)^{\frac{2}{3}} \right)^2$$

- Cubic-root amplitude compression can **boost the effect of pre-emphasis** by further reducing the dynamic range of the speech magnitude spectrum

# Speech Dataset

- For experimental purposes, we use the **TIMIT-1C** speech dataset comprising clean and simulated noisy signals
- Clean signals were artificially distorted by diverse types of **additive noise**
  - Training and validation sets:** car, bus station, restaurant, and street (**seen noises**)
  - Test set:** café, train station, pedestrian street, and bus (**unseen noises**) + *seen noises*
- The training, validation and test sets consider the same discrete set of **SNRs:**  $\{-5, 0, 5, 10, 15, 20\}$  dB
- Neither noise realizations nor speakers overlap across sets

# Experimental Results

**SP** Standard pre-emphasis | **ELP** Equal-loudness pre-emphasis | **I2L** Intensity-to-loudness conversion

- Pre-emphasis filtering has no impact on speech intelligibility
- Best speech quality is achieved by  $\mathcal{L}_{\text{MSE}}^{\text{SP+I2L}} \rightarrow \text{PESQ}$  rel. improv. over the baseline of 4.6% (seen noises) and 3.4% (unseen noises)

# Conclusions and Future Work

## Conclusions

- Results indicate that perceptually balancing the estimated and actual clean speech signals prior to loss calculation allows for obtaining **supplementary speech quality gains** over a conventionally-trained modern speech enhancement system
- Minimal additional computational cost at training time, and *no additional cost at inference time*
- This *simple* and *cheap* methodology may potentially become a **default add-on** for training DNN-based speech enhancement systems

# Conclusions and Future Work

## Future Work

- Investigating the **generalizability** of this pre-emphasis methodology
  - ① Different speech enhancement architectures/approaches
  - ② Different loss functions
- Running **listening tests** to contrast what is predicted by objective speech quality and intelligibility metrics to strengthen the conclusions drawn
